Class 15 RNA-Seq

Claire Chapman

11/17/2021

Read in Data

DESeq2 expects a dataframe of count data and a second dataframe with information about the samples (metadata)

```
counts <- read.csv("airway_scaledcounts.csv", row.names=1)
metadata <-  read.csv("airway_metadata.csv")
```

Take a look

```
head(counts)
```

```
##                 SRR1039508 SRR1039509 SRR1039512 SRR1039513 SRR1039516

```

There are 38694 genes in this dataset

Column names of counts data MUST equal the IDs in metadata. Check this:

```
metadata$id == colnames(counts)
```

```
## [1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE TRUE
```

Exploratory Diff Gene Analysis - Compare control to treated

For demonstration purposes only, never do actual diff analysis this way

Extract row from metadata with controls

```
control <- metadata[metadata[,"dex"]=="control",]
control.counts <- counts[ ,control$id]
control.mean <- rowSums( control.counts )/4
head(control.mean)
```

```
## ENSG00000000003 ENSG00000000005 ENSG00000000419 ENSG00000000457 ENSG00000000460
##          900.75            0.00          520.50          339.75           97.25
## ENSG00000000938
##            0.75
```

OR use dplyr (I prefer)

```
library(dplyr)
```

```
##
## Attaching package: 'dplyr'
```

```
## The following objects are masked from 'package:stats':
##
##     filter, lag
```

```
## The following objects are masked from 'package:base':
##
##     intersect, setdiff, setequal, union
```

```
control <- metadata %>% filter(dex=="control")
control.counts <- counts %>% select(control$id)
control.mean <- rowSums(control.counts)/4
head(control.mean)
```

```
## ENSG00000000003 ENSG00000000005 ENSG00000000419 ENSG00000000457 ENSG00000000460
##          900.75            0.00          520.50          339.75           97.25
## ENSG00000000938
##            0.75
```

```
treated <- metadata %>% filter(dex=="treated")
treated.counts <- counts %>% select(treated$id)
treated.mean <- rowSums(treated.counts)/4
head(treated.mean)
```

```
## ENSG00000000003 ENSG00000000005 ENSG00000000419 ENSG00000000457 ENSG00000000460
##          658.00            0.00          546.00          316.50           78.75
## ENSG00000000938
##            0.00
```

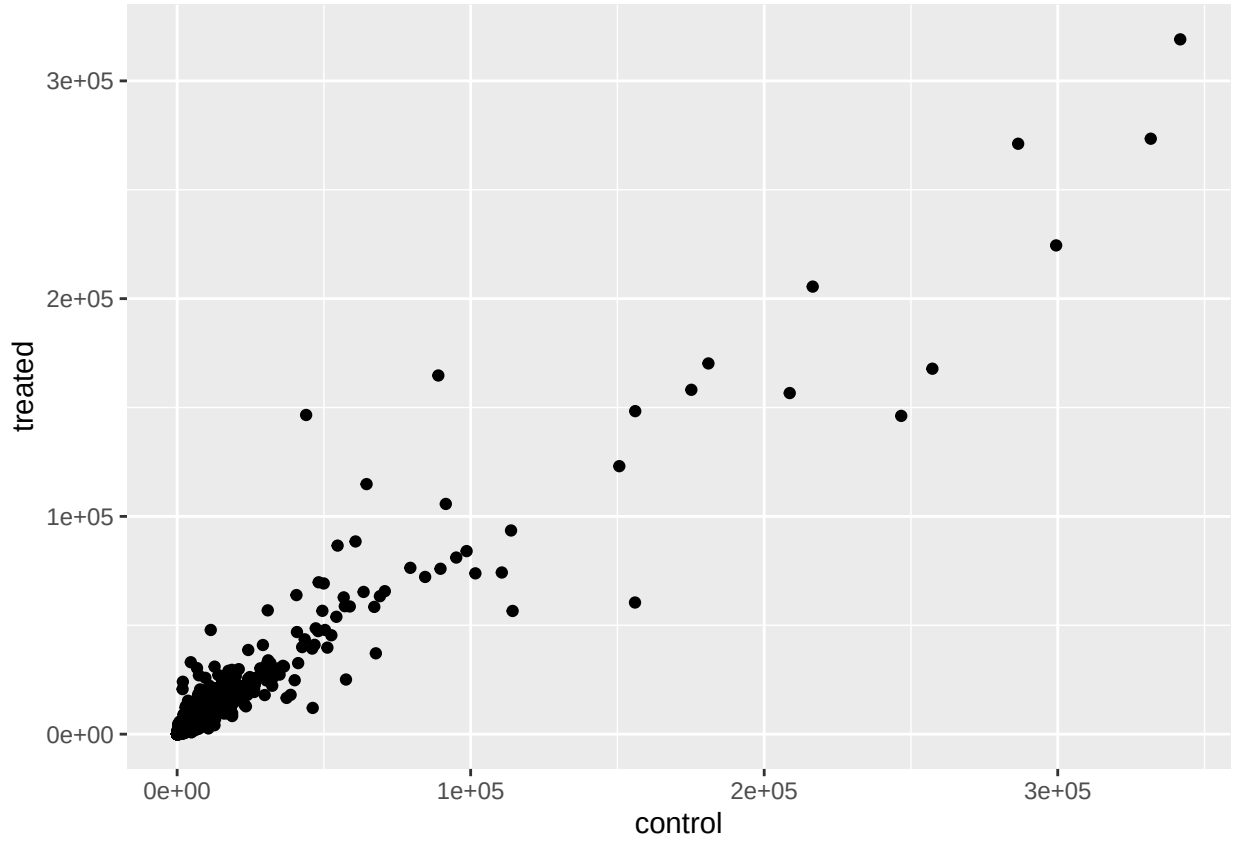
Combine mean count data

```
meancounts <- data.frame(control.mean, treated.mean)
```

Compare the control and treated

Quick scatterplot to check work

```
library(ggplot2)
meancounts %>%
  ggplot(aes(control.mean, treated.mean)) +
  geom_point()+
  labs(x = "control", y = "treated")
```



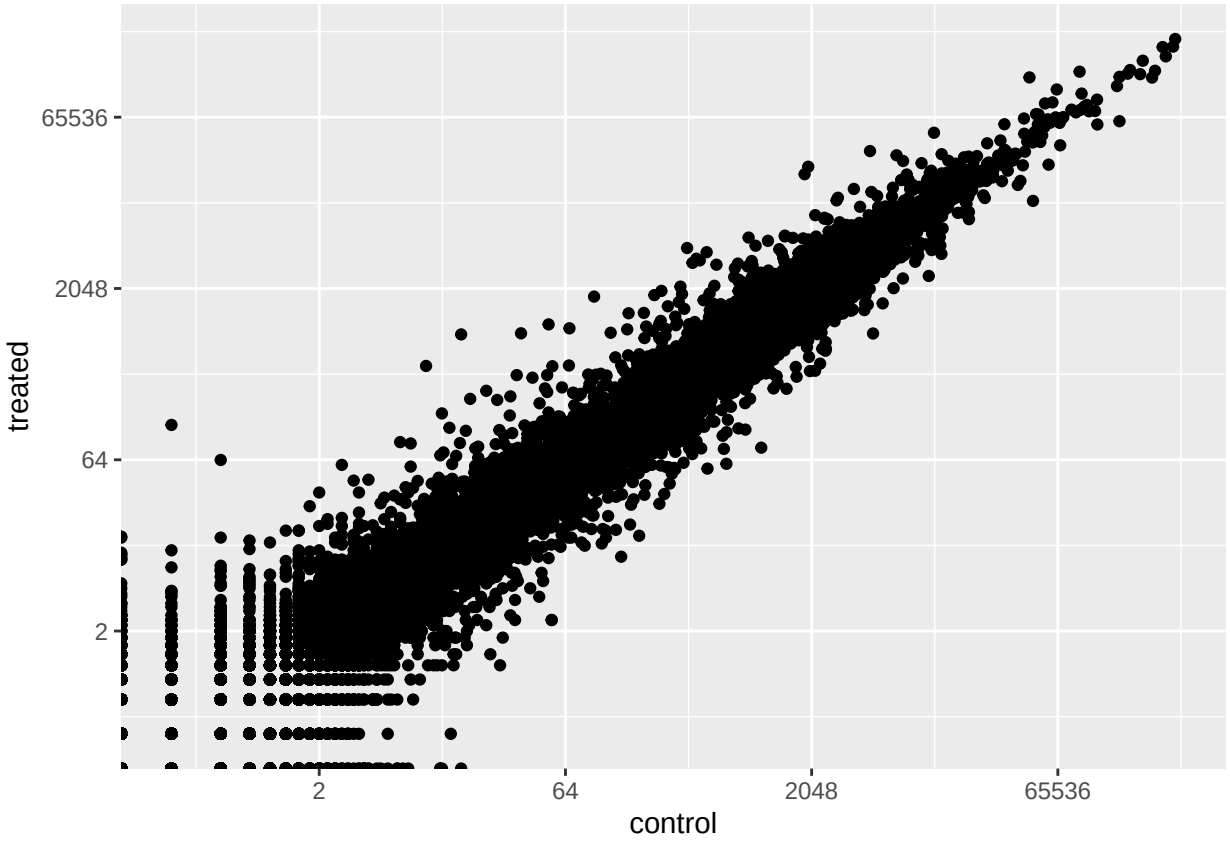
Not truly seeing all the 60,000 data

```
meancounts %>%
  ggplot(aes(control.mean, treated.mean)) +
  scale_y_continuous(trans = "log2")+
  scale_x_continuous(trans = "log2")+
```

```
  geom_point()+
  labs(x = "control", y = "treated")
```

```
## Warning: Transformation introduced infinite values in continuous y-axis
```

```
## Warning: Transformation introduced infinite values in continuous x-axis
```



We often use log transformations to make life easier...

If there is no difference, log change is 0

```
log2(20/20)
```

```
## [1] 0
```

If there is twice as much, expression goes up, log change is 1

```
log2(40/20)
```

```
## [1] 1
```

If there is half as much, expression goes down, log change is -1

```
log2(10/20)
```

```
## [1] -1
```

Transform our data Adding a column called log2 fold change representing log2(treated/control)

```
meancounts$log2fc <- log2(meancounts[,"treated.mean"]/meancounts[,"control.mean"])
```

```
head(meancounts)
```

```
##                 control.mean treated.mean      log2fc
## ENSG00000000003       900.75       658.00 -0.45303916
## ENSG00000000005         0.00         0.00         NaN
## ENSG00000000419       520.50       546.00  0.06900279
## ENSG00000000457       339.75       316.50 -0.10226805
## ENSG00000000460        97.25        78.75 -0.30441833
## ENSG00000000938         0.75         0.00        -Inf
```

You get some weird values "NaN" when you try to divide by zero "-inf" Need to exclude the zeros

```
head(meancounts[,1:2] == 0)
```

```
##                 control.mean treated.mean
## ENSG00000000003        FALSE        FALSE
## ENSG00000000005         TRUE         TRUE
## ENSG00000000419        FALSE        FALSE
## ENSG00000000457        FALSE        FALSE
## ENSG00000000460        FALSE        FALSE
## ENSG00000000938        FALSE         TRUE
```

the `which()` function tells us the indices of TRUE entries in a logical vector. It is not useful in default mode, doesn't break between columns. Need to argue with it.

```
inds <- which(meancounts[,1:2] == 0, arr.ind = TRUE)
head(inds)
```

```
##                 row col
## ENSG00000000005   2   1
## ENSG00000004848  65   1
## ENSG00000004948  70   1
## ENSG00000005001  73   1
## ENSG00000006059 121   1
## ENSG00000006071 123   1
```

Some genes have 0 value in both columns, so select unique values

```
to.rm <- unique(inds[,1])
mycounts <- meancounts[-to.rm,]
head(mycounts)
```

```
##                 control.mean treated.mean      log2fc
## ENSG00000000003       900.75       658.00 -0.45303916
## ENSG00000000419       520.50       546.00  0.06900279
## ENSG00000000457       339.75       316.50 -0.10226805
## ENSG00000000460        97.25        78.75 -0.30441833
## ENSG00000000971      5219.00      6687.50  0.35769358
## ENSG00000001036      2327.00      1785.75 -0.38194109
```

We now have 21817 genes remaining.

Up-regulation and Down-regulation

A common threshold for log2fc is up-regulated if > 2 and down-regulated if < -2.

```
up_reg <- mycounts$log2fc > 2
down_reg <- mycounts$log2fc < -2
```

```
sum(up_reg)
```

```
## [1] 250
```

There are 250 genes up-regulated, or 1.1458954 %

There are 367 genes down-regulated or 1.6821745 %

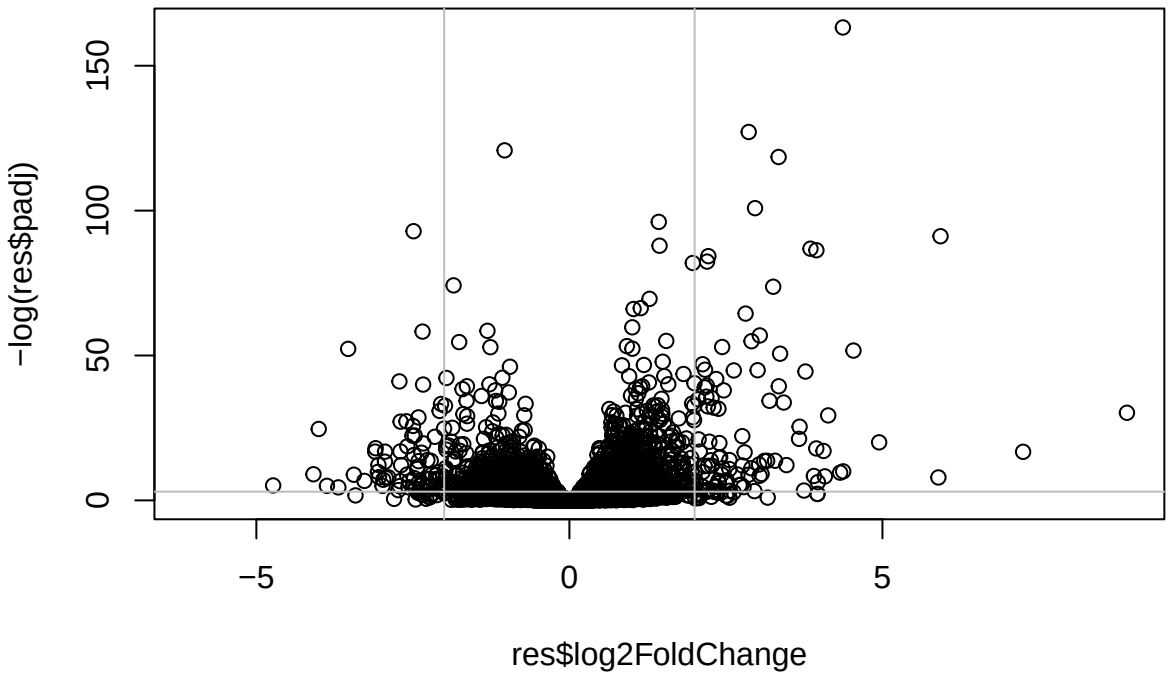
Volcano plot

Common way to visualize the results Add lines at our -2, 2 fc thresholds and at the significant p value threshold. We are interested in the top left and top right quadrants.

```
plot(res$log2FoldChange, -log(res$padj))
abline(v = c(-2,2), col = "gray")
abline(h = -log(0.05), col = "gray")
```



Adding annotation data

Use Bioconductor's main annotation packages. Must first install these packages in the console.

```
library("AnnotationDbi")
```

```
##
## Attaching package: 'AnnotationDbi'

## The following object is masked from 'package:dplyr':
##
##     select
```

```
library("org.Hs.eg.db")
```

```
##
```

```
columns(org.Hs.eg.db)
```

```
##  [1] "ACCNUM"       "ALIAS"        "ENSEMBL"      "ENSEMBLPROT"  "ENSEMBLTRANS"
##  [6] "ENTREZID"     "ENZYME"       "EVIDENCE"     "EVIDENCEALL"  "GENENAME"
## [11] "GENETYPE"     "GO"           "GOALL"        "IPI"          "MAP"
## [16] "OMIM"         "ONTOLOGY"     "ONTOLOGYALL"  "PATH"         "PFAM"
## [21] "PMID"         "PROSITE"      "REFSEQ"       "SYMBOL"       "UCSCKG"
## [26] "UNIPROT"
```

We want to make a new value "SYMBOL" that includes the common gene name that will be widely recognized and used.

```
res$symbol <- mapIds(org.Hs.eg.db,
                     keys=row.names(res), # Our genenames
                     keytype="ENSEMBL",        # The format of our genenames
                     column="SYMBOL",          # The new format we want to add
                     multiVals="first")
```

```
## 'select()' returned 1:many mapping between keys and columns
```

```
head(res)
```

```
## log2 fold change (MLE): dex treated vs control
## Wald test p-value: dex treated vs control

```

Now let's save it for next time!

```
write.csv(res, file = "DESeq_results.csv")
```
